

ABSTRACT:

A projection device that can be installed in an automobile to project visual media in a way that the images reflect on the front glass through various manipulations (such as insertion of a concave device inside the two parallel panes of glass along or a slight tint on the inner pane glass) that give the window the properties of reflecting the projection image as well as keeping its transparency. The placement of the projection device can be placed in the car as an installed unit in the front headboard on the driver side or it can be a separate unit. The idea consists of the manipulation of the glass as well as the placement of the projection image.
